SATURNSUB - SUBMERSIBLE PUMPS IN COMPOSITES

Argal proposes in this catalog its new range of submersible pumps made in Fiber Reinforced Polymers (FRP).

CONSTRUCTION DATA

Submersible electric pumps, robust in construction, watertight electric motors accommodated in compartment, connected, by shafts of reduced lengths, to the impellers situated at the pump casing by the interposition of oil chamber between the hydraulic side and the electric motor.

THE COMPOSITES MADE ARGAL PUMPS OFFER MAXIMUM CHEMICAL AND MECHANICAL RESISTANCE.

Pumps are obtained deploying composite materials made of vinyl ester resins reinforced with long strand only glass fibres moulded with RTM technique in its factory located in Brescia.

Pumps and parts wet by the liquid pumped in particular have important prerogatives:

- high chemical resistance (the highest among resins, polyester);
- mechanical resistance comparable to some metal alloys;
- dimensional stability, characteristic of the thermosetting resins which during catalysis transform themselves irreversibly becoming insoluble and infusible;
- abrasion resistance and resistance to aging;
- resistance to low and high temperatures (from -30°C to + 110°C);
- lightness typical of composites which, because of differentiated modulus of elasticity for the various parts of the pump and with the minimum thickness of 20 mm exceed the hydrostatic tests from 20 to 50 bar;
- resistance to flame propagation in case of fire.

MATERIALS PROFILE OF PUMPING PARTS

Pump Casings

Pump casings of **SATURNSUB** are of the following types of FRP:

- V1G** standard vinyl ester resin for general use;
- V1A** mixture of vinyl ester resin for abrasive liquids;
- V1C** mixture of vinyl ester resin for liquids with chlorine;
- V1F** mixture of vinyl ester resin for liquids with fluorine.

Electric motor

MAIN FEATURES

Shafts rectified down in ball bearings and mechanical seals seats, oversized compared to standard parameters of use, dynamically balanced.

Motor asynchronous three phase squirrel cage type, insulation class H (180°C). Dry motor, cooled by surrounding liquid. Protection degree IP 68. The motor is designed to continuous or intermittent operation, with a maximum of 15 starts per hour at regular intervals with 5% maximum of voltage imbalance between phases. **Ball bearings** over dimensioned, life lubricated, maintenance free.

Oil chamber. Oil lubricates and cools the seals and emulsifies eventual water infiltrations.

Mechanical seals

This electric pump has two types of seals for a perfect insulation between the electric motor and the pumped liquid.

Upper seal: mechanical, ceramic / graphite.

Lower seal: mechanical, Silicon Carbide / Silicon Carbide / Viton.

OPTION

Thermal protection

The thermal protections, connected singularly or in three groups within the windings of the stator, detect their temperature of exercise and switch-off the contact when the detected temperature achieve up to the set value for which they have been constructed within a tolerance of ± 3%. The thermal sensors start , once well connected to the control panel, safeguard motor from the risk of overloading and eventual burning.

ACCESSORY

SAFETY BOX LT2-A

The Safety Box LT2-A detects the safety devices installed inside submerged pumps. This device is divided in two sections: the first is specialised for the thermal protectors, the second one is specialised for detecting water seepage (infiltration) in the oil box. In the first case by means of bimetallic or PTC thermistor sensors applied inside the electric motor coils, the device LT 2 detects the temperature increase, no matter is the cause (heavy or repeated starts up, single phase operation, extended overload etc). In the applications with PTC thermistor the device controls that the sensors are not in short circuit (resistance lower than 25-30Ω). The second section of the device detects the water infiltration inside the machine, basing on a sensitivity variable from 10kΩ to 70 kΩ.

PUMP INSTALLATION SUPPLIES

- FRP delivery pipe system
- Automatic submerged coupling foot system

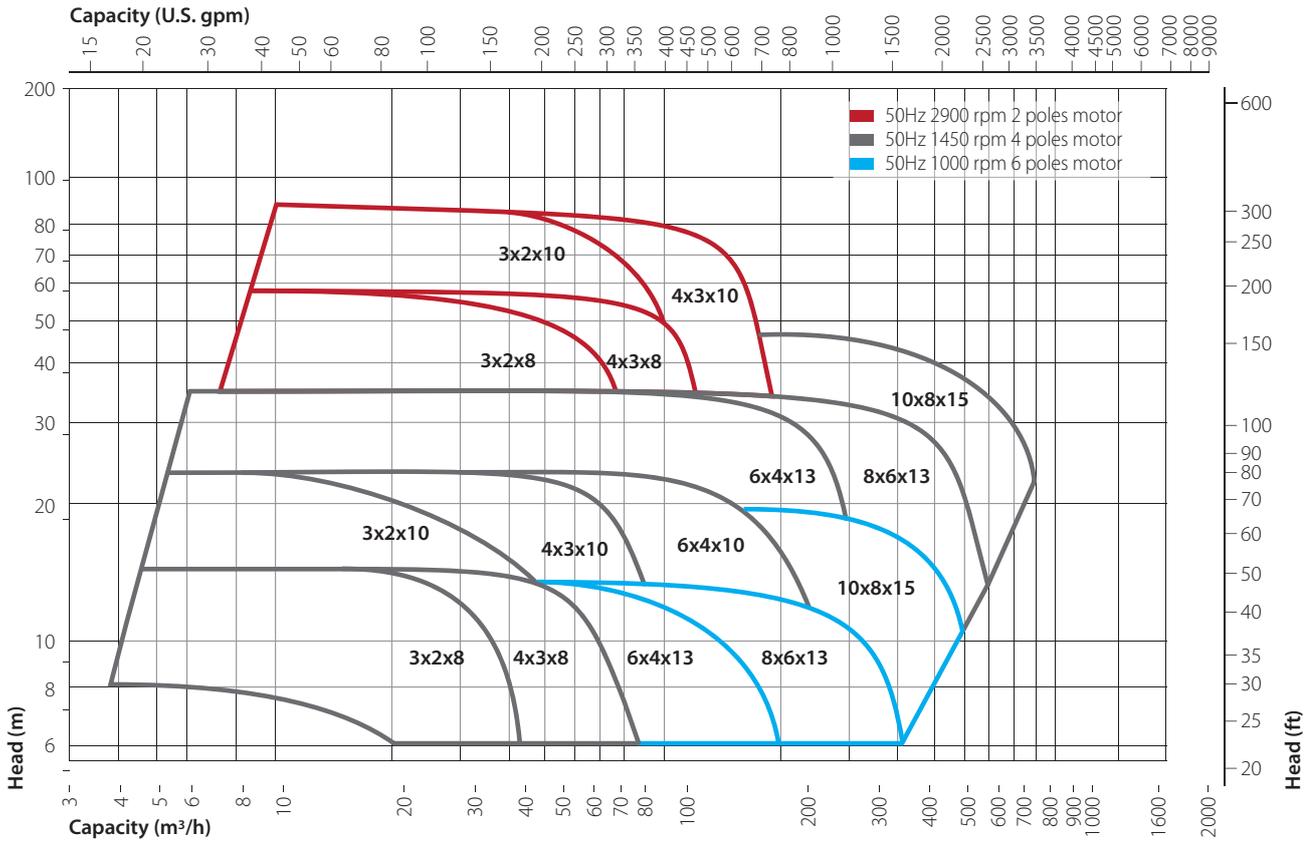

Argal operates with ISO 9001:2000 Quality System certified by SQS-Iqnet.

The submersible FRP pumps with stainless steel AISI 316L motors are used for pumping aggressive and corrosive liquids from disposal of wastewater of chemical plants to various applications with seawater.

Depending on its own know-how and domestic production experience of Fiberglass centrifugal pumps, ARGAL has been able to extend its production program to these new submersible pumps with original creation in thermoset resins.
